RIVA Firewall Monitor is a network firewall that includes a full-featured centralized server, and lightweight client. The server works with dynamic and static firewall rules. It can work on Linux, Windows and FreeBSD. It is based on the RTOS FreeS/WAN, which includes several features that are useful for network monitoring, including a TCP SYN monitor. The firewall server is easy to use. It features a dashboard that provides a list of the active firewall rules and other information. It also has a password manager that keeps your password history safe. For each rule, it shows the conditions, the action and the result, in addition to the IP address, TCP port, target interface and traffic direction. You can control the firewall using the built-in Web browser, in addition to the standard command line interface. The graphical user interface uses two color themes: one for the administrative sections and another for the main rule list. You can also create your own styles for the GUI. Finally, the firewall can be installed on a network device, such as a computer, router, switch or access point, and run in on-demand mode. This allows you to easily monitor the firewall status without disturbing your network. You can use RIVA Firewall Monitor to: * Manage firewall rules * Monitor multiple network devices from a central place * Verify the status of your firewall from any computer * Keep track of your admin passwords * Track your firewall traffic RIVA Firewall Monitor is a feature-packed server that is easy to use. It is based on the RTOS FreeS/WAN, which provides many useful features that you may not have found in other solutions. In addition to the standard features, it includes a firewall monitoring section, which will monitor your network for any exceptions. You will be alerted if there are any unauthorized accesses, DNS queries, FTP sessions or DNS attacks. It also includes a password manager that keeps track of your password history and stores the passwords to prevent brute force attacks. You will never have to remember your admin credentials again. Finally, the firewall can be installed on a network device, such as a computer, router, switch or access point, and run in on-demand mode.
